

Permaculture Master Plan

Installed in stages, this single-family property was transformed from a hodgepodge of single-use plants and wasted space into a multi-functional series of connected outdoor living and production spaces that serve the client's needs for food production, ecological resilience, low maintenance landscaping, and aesthetics that both challenge the standard look of and yet fit in with her neighborhood.

Highlights include:

- **Focal point with fountain and native Vine Maples under an arbor.
- **Stormwater retention & conveyance supports plantings.
- **Pollinator plants & habitat for beneficial amphibians.
- **Mostly edible landscape.
- **Native plants wherever possible.
- **Recycled & local materials.
